# Extending MISP with Python modules

EXTENDING MISP WITH PYTHON MOD-ULES

#### WHY WE WANT TO GO MORE MODULAR...

- Ways to extend MISP before modules
  - ► APIs (PyMISP, MISP API)
    - Works really well
    - No integration with the UI
  - ► Change the core code
    - Have to change the core of MISP, diverge from upstream
    - Needs a deep understanding of MISP internals
    - Let's not beat around the bush: **Everyone hates PHP**

Extending MISP with Python modules

L

2022-

—Why we want to go more modular...

HY WE WANT TO GO MORE MODULAR...

Ways to extend MISP before modul

APIs (PyNISP, NISP API)

Works really well

In interestion with the UI

■ No integration with the UI ► Change the core code

Have to change the core of MISP, diverge from up
 Needs a deep understanding of MISP internals
 Let's not beat around the bush: Everyone hates P

#### GOALS FOR THE MODULE SYSTEM

- Have a way to extend MISP without altering the core
- Get started **quickly** without a need to study the internals
- Make the modules as light weight as possible
  - Module developers should only have to worry about the data transformation
  - ► Modules should have a simple and clean skeleton
- In a friendlier language **Python**

MISP MODULES - EXTENDING MISP WITH PYTHON SCRIPTS

- modules with zero customization in MISP.

  A simple ReST API between the modules and MISP allowing auto-discovery of new module
- with their features.

  Benefit from existing Python modules in Viper or any other
- modules in Viper or any other tools.
- MISP modules functionnalit introduced in MISP 2.4-28.
- MISP import/export module: introduced in MISP 2.450.

#### MISP MODULES - INSTALLATION

- MISP modules can be run on the same system or on a remote server.
- Python 3 is required to run MISP modules.
  - sudo apt-get install python3-dev python3-pip libpq5
  - cd /usr/local/src/
  - ▶ sudo git clone https://github.com/MISP/misp-modules.git
  - cd misp-modules
  - ► sudo pip3 install -I -r REQUIREMENTS
  - sudo pip3 install -1.
  - ► sudo vi /etc/rc.local, add this line: 'sudo -u www-data misp-modules -s &'

Extending MISP with Python modules

-MISP modules - installation

remote server. # Python 3 is required to run MISP modules

#### MISP MODULES - SIMPLE REST API MECHANISM

- http://127.0.0.1:6666/modules introspection interface to get all modules available
  - returns a JSON with a description of each module
- http://127.0.0.1:6666/query interface to **query a specific** module
  - ► to send a JSON to query the module
- MISP autodiscovers the available modules and the MISP site administrator can enable modules as they wish.
- If a configuration is required for a module, MISP adds automatically the option in the server settings.

#### MISP MODULES - HOW IT'S INTEGRATED IN THE UI?

Enrichment Results

Below you can see the attributes that are to be created. Make sure that the categories and the types are correct, other several options will be offered based on an inconclusive automatic resolution.

20

Extending MISP with Python modules

└─MISP modules - How it's integrated in the UI?

#### MISP MODULES - MAIN TYPES OF MODULES

- Expansion modules enrich data that is in MISP
  - Hover type showing the expanded values directly on the attributes
  - Expansion type showing and adding the expanded values via a proposal form
- Import modules import new data into MISP
- Export modules export existing data from MISP

Extending MISP with Python modules

-MISP modules - main types of modules

SP MODULES - MAIN TYPES OF MODULES

■ Expansion modules - enrich data that is in MISP

► Hover type - showing the expanded values directly on

► Expansion type - showing and adding the expanded value via a monocal form

Import modules - import new data into MISP

022-09

575-03 50-220

■ curl -s http://127.0.0.1:6666/query -H "Content-Type: application/json" -data @body.json -X POST

body.json

{"module": "dns", "hostname": "www.circl.lu"}

and the response of the dns module:

1

{"results": [{"values": ["149.13.33.14"], "types": ["ip-src", "ip-dst"]}]}

└─Querying a module

#### CREATING YOUR MODULE - DNS MODULE

```
import ison
import dns.resolver
misperrors = {'error' : 'Error'}
mispattributes = {'input': ['hostname', 'domain'], 'output': ['ip-src', 'ip-dst']}
moduleinfo = {'version': '0.1', 'author': 'Alexandre Dulaunoy',
              'description': 'Simple DNS expansion service to resolve IP address from MISP attributes', 'module-type': ['expansion', 'hover']}
def handler(q=False):
   if q is False:
       return False
   request = json.loads(q)
   if request.get('hostname'):
   elif request.get('domain'):
       toquery = request['domain']
       return False
   r = dns.resolver.Resolver()
       answer = r.query(toquery, 'A')
   except dns.resolver.NXDOMAIN:
       misperrors['error'] = "NXDOMAIN"
       return misperrors
   except dns.exception.Timeout:
       misperrors['error'] = "Timeout"
       return misperrors
       misperrors['error'] = "DNS resolving error"
       return misperrors
   r = {'results': [{'types': mispattributes['output'], 'values':[str(answer[o])]}]}
   return r
def introspection():
   return mispattributes
def version():
   return moduleinfo
```
